1. Introduction

Dear Customer,

Thank you for choosing a HygroMatik steam humidifier.

HygroMatik steam humidifiers represent the latest in humidification technology.

In order to operate your HygroMatik steam humidifier safely, properly and efficiently, please read these operating instructions.

Employ your steam humidifier only in sound condition and as directed. Consider potential hazards and safety issues and follow all the recommendations in these instructions.

If you have additional questions, please contact your expert dealer.

For all technical questions or spare parts orders, please be prepared to provide unit type and serial number (see name plate on the unit).

1.1 Typographic Distinctions

- preceded by a bullet: general specifications
- preceded by an arrow: Procedures for servicing or maintenance which should or must be performed in the indicated order
- Installation step which must be checked off.

italics Terms used with graphics or drawings

1.2 Documentation

Please note

In addition to this manual, the appropriate FlexLine Control documentation is mandatory for the operation of the unit.

Retention

Please retain these operating instructions in a secure, always accessible location. If the product is resold, turn the documentation over to the new operator. If the documentation is lost, please contact HygroMatik.

1.3 Symbols in Use

1.3.1 Specific Symbols related to Safety Instructions

According to ANSI Z535.6 the following signal words are used within this document:

⚠️ DANGER

DANGER indicates a hazardous situation which, if not avoided, will result in death or serious injury.

⚠️ WARNING

WARNING indicates a hazardous situation which, if not avoided, could result in death or serious injury.

⚠️ CAUTION

CAUTION indicates a hazardous situation which, if not avoided, could result in minor or moderate injury.

NOTICE

NOTICE is used to address practices not related to physical injury.

1.3.2 General Symbols

Please note

This symbol is used whenever a situation requires special attention beyond the scope of safety instructions.
1.4 Intended Use

HygroMatik electrode steam humidifiers serve for steam production based on tap water or partially softened water.

Only use supply water featuring a conductivity of 125 to 1250 µS/cm.

D1: Lower threshold
C1: Range of reduced conductivity (adjustment required)
A: Normal Tap water
B: Range of increased conductivity
C2: Range of high conductivity (adjustment required)
D2: Upper threshold

In the C1 and C2 ranges, adaptation of the periodic blow-down frequency may be required. Pls. refer to parameter „2-1“ and „2-2“ explanations given in the „Detailed parameter descriptions“ section.

Proper usage also comprises the adherence to the conditions specified by HygroMatik for:

- installation
- dismantling
- reassembly
- commissioning
- operation
- maintenance
- disposal.

Only qualified and authorised personnel may operate the unit. Persons transporting or working on the unit must have read and understood the corresponding parts of the Operation and Maintenance Instructions and especially the chapter 2. „Safety Notes“. Additionally, operating personnel must be informed of any possible dangers. You should place a copy of the Operation and Maintenance Instructions at the unit's operational location (or near the unit).

By construction, HygroMatik steam humidifiers are not qualified for exterior application.

⚠️ WARNING ⚠️

Risk of scalding!
Steam with a temperature of up to 100 °C (212° F) is produced.
Do not inhale steam directly!
2. Safety Instructions

These safety instructions are required by law. They promote workplace safety and accident prevention.

2.1 Guidelines for Safe Operation

2.1.1 Scope
Comply with the accident prevention regulation „DGUV Regulation 3“ to prevent injury to yourself and others. Beyond that, national regulations apply without restrictions.

2.1.2 Unit control
Do not perform any work which compromises the safety of the unit. Obey all safety instructions and warnings present on the unit.

In case of a malfunction or electrical power disruption, switch off the unit immediately and prevent a restart. Repair malfunctions promptly.

⚠️ WARNING

Restricted use.
IEC 60335-1 stipulates as follows:
This device may be used by children of eight years of age and above as well as by persons with reduced physical, sensory or mental capabilities or lack of experience and knowledge so long as they are supervised or have been instructed regarding the safe use of the device and understand the hazards that may result from it. Cleaning and user maintenance of the unit must not be undertaken by children without supervision.

2.1.3 Unit Operation

⚠️ WARNING

Risk of scalding!
Uncontrolled hot steam escape in case of leaking or defective components possible. Switch off unit immediately.

---

NOTICE

Risk of material damage!
The unit may be damaged if switched on repeatedly following a malfunction without prior repair.
Rectify defects immediately!

The unit must not be operated on a DC power supply.
The unit may only be used connected to a steam pipe that safely transports the steam.
Regularly check that all safety and monitoring devices are functioning normally. Do not remove or disable safety devices.
2.1.4 Mounting, dismantling, maintenance and repair of the unit

**NOTICE**

The HygroMatik steam humidifier is IP20 protected. Make sure that the unit is not object to dripping water in the mounting location.

Installing a humidifier in a room without water discharge requires safety devices to protect against water leakages.

- Use genuine spare parts only
- After any repair work, have qualified personnel check the safe operation of the unit
- Attaching or installing of additional components is permitted only with the written consent of the manufacturer

2.1.5 Electrical

**WARNING**

Risk of electrical shock!
Hazardous electrical voltage!

Any work on the electrical system to be performed by certified expert staff (electricians or expert personnel with comparable training) only.

Disconnect unit components from electrical power supply prior to work.

After electrical installation or repair work, test all safety mechanisms (such as grounding resistance).

**NOTICE**

Use only original fuses with the appropriate amperage rating.

Regularly check the unit’s electrical equipment. Promptly repair any damage such as loose connections or burned wiring.

Responsibility for intrinsically safe installation of the HygroMatik steam humidifiers is incumbent on the installing specialist company.

2.2 Disposal after dismantling

**NOTICE**

The operator is responsible for the disposal of unit components as required by law.
3. Transport

3.1 Overview

**Please note**
Proceed carefully when transporting the steam humidifier in order to prevent damage due to stress or careless loading and unloading.

3.2 Packing

**Please note**
Pay attention to the icons affixed to the packing box.

3.3 Interim Storage

Store the unit in a dry place and protect from frost and strong sunlight.

3.4 Check for Complete and Correct Delivery of Goods

Upon receipt of the unit, confirm that:

- model and serial number on the name plate match those specified in the order and delivery documents
- the equipment is complete and all parts are in perfect condition

**Please note**
In case of damage from shipment and/or missing parts, immediately notify the carrier or supplier in writing.

**Time limits for filing freight claims with shipping companies are***:

<table>
<thead>
<tr>
<th>Shipping company</th>
<th>After receipt of goods</th>
</tr>
</thead>
<tbody>
<tr>
<td>Carriers</td>
<td>no later than 4 days</td>
</tr>
<tr>
<td>Parcel service</td>
<td>immediately</td>
</tr>
</tbody>
</table>

* Time limits for some services subject to change.
4. Functional Description and Device Composition

4.1 Mode of Action

Making use of the frictional heat caused by current flow in a water tank

The HygroMatik humidifier utilizes the conductivity normally present in tap water for steam production. Electrodes inside an enclosed steam cylinder are immersed directly into the tap water. They are connected to the alternating current. The conductivity of the water generates an electric current between the electrodes. In this way, the electric power supplied is converted directly into heat without energy loss. The steam produced has a temperature of about 100°C (212°F) with minimal excess pressure ("pressureless steam"). It is largely free of minerals and germ-free. Mineral deposits typically remain behind in the cylinder.

4.2 Mechanical Construction

The FlexLine humidifiers are designed for wall mounting. For maintenance purposes, the steam cylinders are separable in the middle.

**Please note**

Starting with the manufacturing date of 11/2018, the steam humidifiers FLE50/65/100/130 make use of a modified steam cylinder that are separable in the upper part of the wall. When replacing the steam cylinder, the new cylinders with the designation „CY45/2“ may be incorporated in the older units as well. With the steam cylinder modification also the electrodes have changed. The new electrodes only fit in the new steam cylinders. The cylinders CY45/2 allow for unit operation without a cylinder star even in case of high conductivity of the cylinder water.
4.3 Operating sequence

By pressing the control switch („Pos. I“) the humidifier is turned on. When the controller specifies an increase in humidity, the main contactor is switched on and the electrodes (48) are supplied with power. The water inlet solenoid valve (25) feeds water into the steam cylinder (16).

As soon as the electrodes are immersed, the current begins to flow. The water is now heated. When the pre-selected output is reached, the control turns off the solenoid valve and interrupts the water supply.

After a short heating up period, the water between the electrodes begins to boil and vaporize. The vaporization lowers the water level in the steam cylinder, reducing the output provided. The inlet solenoid valve, equipped with a fine mesh filter, intermittently admits fresh water.

Humidifier power usage is continuously monitored. With a cold start-up, the nominal current increases to 113% in order to achieve quick-start output parameters. This activates the electronic overflow limiter which causes a partial draining of the cylinder. This reduces the immersed surface area of the electrodes, lowering power usage.

The concentration of dissolved salts increases over time, which can lead to a rise in the conductivity of the water. If this continues, conductivity may increase until a short circuit occurs. This could damage the unit, but in any case would significantly reduce the life span of the electrodes.

For this reason, regular, periodic blow-downs of some of the concentrated water are very important. Following this procedure as recommended provides stable cylinder water conductivity as well as minimal water loss for the expected service life of the cylinder.

Water blow-down is performed by a blow-down pump (32). The functioning of the blow-down pump is continuously monitored during operation. If the pump is damaged, the steam humidifier shuts down.

With normal water quality the blow-down loss rate lies between 7 and 15 % of the amount of steam produced. Depending on water quality, a full steam cylinder blow-down is run every 3 to 8 days.

Mineral deposits settle in the open area below the electrodes and are removed through periodic maintenance. The blow-down pump itself has wide openings and can flush out smaller pieces of mineral deposit. This extends the service life of the unit and reduces the required maintenance interval.

On blow-down, water flows from the pump into the drainage system.

For maintenance purposes, the cylinder water may be pumped out by pressing and holding the control switch in the „II“ position.

Monitoring max. level

A sensor electrode (10) monitors the maximum water capacity of the cylinder. When the water level reaches the sensor electrode, the water supply is interrupted. This can occur when the water has low conductivity or when the electrodes are worn out. In the case of low water conductivity, however, this state usually lasts only a short time. The built-in control and the large area electrodes combine to produce a rapid rise in conductivity by increasing the concentration of the water.

*) numbers indicated correspond with those in the exploded view in the „Exploded view“ chapter.
5. Mechanical installation

⚠️ WARNING

Risk of foot injuries!
Prevent unit from dropping during installation!
Helping hand of a second person is advisable.

⚠️ WARNING

Risk of electrical shock!
Hazardous electrical voltage.
During installation, the unit must be disconnected from power supply.

5.1 Environment Parameters to be met and Mounting Recommendations

When selecting the installation site for the steam humidifier, take the following into account:

- The minimum clearances indicated in the fitting measures section must be observed in order to ensure adequate unit ventilation and allow for unobstructed access in case of maintenance
- Protection class IP20
- By design, HygroMatik steam humidifiers are not qualified for outdoor installation (electrocal components and water-bearing parts may be damaged)
- Ambient temperature must lie between +5 and +40 °C (+41 and +104 °F) in order to protect the unit electronics against damage; frost may damage the steam cylinder, the solenoid valve and pump, as well as make hoses burst
- Relative humidity must not exceed 80 % r.h., since values beyond may lead to electronic malfunction or damage
- Installation in a closed room requires aeration and, eventually, temperature conditioning in order to meet the a.m. environmental conditions
- The steam humidifier should be installed as close as possible to the steam manifold. Optimum performance is only guaranteed when steam and condensate hoses are kept short
- Make use of existing water connections for supply and draining
- Hoses must be laid at a consistent 5 to 10 % incline/decline; sagging and kinking prevention is a must
- Mount the unit on a stable, preferably solid wall offering the bearing capacity required (s. unit technical specifications). If such a wall is not at hand, the unit may be attached to a stand bracket firmly bolted to the floor
- For proper functioning of the level control, plumb and level installation of the unit is required
- The steam humidifier rear panel heats up during operation to a maximum of 70 °C (158 °F). Take care that the construction on which the unit is to be mounted is not made of temperature-sensitive material

</tbody>
</table>

Wall clearances
When mounting the steam humidifier, the wall clearances shown in the fig. below must be obeyed:

Mounting principle
For wall mounting drill measures, please consult the table above (measure A). In case of no suitable wall available for mounting the unit, it is recommended that installation is made on brackets firmly anchored in the floor.

» mark the holes for the upper suspension brackets screws
» drill holes and dowel
» screw in the supplied mounting screws; let the screws protrude approx. 12 mm/.5 inch from wall
» ensure firm fixation and load-carrying capacity of the mounted screws!
» hook in the unit and ensure safe suspension
» mark the holes for the lower suspension brackets screws
» remove the unit
» drill holes and dowel
» hook in the unit and mount the lower screws firmly

To function properly, the steam humidifier must hang level and plumb.
Device connections:

- DN25, DN40 Steam outlet
- ¾" Water inlet
- Cable entries
- 1¼" Waste water connection
5.2 Unit Installation Check

Before start-up, pls. check proper unit installation following the list below:

☑️ Unit perpendicularly aligned in both the vertical and horizontal axis?
☑️ All clearances obeyed?
☑️ Steam hose installed with a 5 - 10 % minimum incline/decline (see chapter "Steam line")?
☑️ Condensate hose features a loop functioning as a steam barrier (see chapter “Condensate hose”)?
☑️ Steam manifold(s) properly positioned?
☑️ All bolts and clamps properly tightened?
☑️ Steam manifold(s) horizontally mounted and suspended on the free end, if required?
☑️ All seals (o-rings) in place?
☑️ All ventilation slots on housing top unobscured?
5.3 Absorption Distance \( B_N \)

The "absorption distance" \( (B_N) \) is defined as the distance from the steam feed to where the steam is completely absorbed in the treated air. Within the absorption distance, steam is visible as mist in the air stream.

Condensation may occur on anything installed within the absorption distance.

Although steam outside the absorption distance \( (B_N) \) is completely absorbed, it is not yet evenly diffused in the duct. If you plan to install any parts or devices inside the absorption distance, such as sensors or elbows, we recommend increasing the absorption distance using the formulae below. The absorption distances required for certain installed fittings are distinguished by separate symbols and calculated as a multiplier of the absorption distance \( B_N \).

The absorption distance has no fixed value, but depends on many factors. These are depicted in the absorption distance nomogram below.

### Absorption Distance

<table>
<thead>
<tr>
<th>( B_N )</th>
<th>for normal obstructions such as sensors, ventilators, outlets</th>
</tr>
</thead>
<tbody>
<tr>
<td>( B_C = (1.5...2) \times B_N )</td>
<td>for fine filters, heat registers</td>
</tr>
<tr>
<td>( B_S = (2.5...3) \times B_N )</td>
<td>for particle filters</td>
</tr>
<tr>
<td>( B_D = (3...5) \times B_N )</td>
<td>for humidity sensors, duct humidistats</td>
</tr>
</tbody>
</table>

### 5.3.1 Determining the Absorption Distance

To determine the absorption distance, the following parameters are required:

- Air humidity before humidification \( x_1 \) in g/kg
- Air temperature after humidification \( t_2 \) in °C (with steam humidifiers the change in air temperature due to humidification may be disregarded \( t_1 \) or \( t_2 \))
- Specific increase in humidity \( \Delta x \) in g/kg (can be determined in the \( h, x \) diagram)
- Quantity of steam introduced \( m_D^o \) in kg/h.
- Air speed \( w_L \) in m/s in air duct
- Total length \( l_D \) of the steam manifold installed in the air duct

Length \( l_D \) of the usable steam manifold depends on the dimensions of the air duct. The length of the absorption distance can be reduced by using multiple steam manifolds (also see section on the steam manifold).

### Method:

Graphically determine absorption distance \( B_N \) using the absorption distance nomogram (also see Section „Absorption Distance Nomogramm“). Enter the value of the parameters enumerated above into the respective quadrants. The resulting point of intersection indicates the value of the desired absorption distance \( B_N \).

### Notes:

- Air humidity before humidification \( x_1 \)......[g/kg]
- Air temperature after humidification \( t_2 \)......[°C]
- Specific increase in humidity \( \Delta x \).........[g/kg]
- Quantity of steam introduced \( m_D^o \)..............[kg/h]
- Air speed \( w_L \).............................................[m/s]
- Total length of steam manifold \( l_D \)..........[mm]
5.3.2 Absorption Distance Nomogram

Example
Given: circulating air mode
\( x_i = 5 \text{ g/kg}, \Delta x = 3 \text{ g/kg} \)
\( t_i (\approx t_f) = 20^\circ \text{C} \)
\( \dot{m}_0 = 100 \text{ kg/h}, l_0 = 1,25 \text{ m} \)
\( w_L = 5 \text{ m/s} \)

Result:
absorption distance \( B_n \approx 0.8 \text{ m} \)

5.4 Steam Manifold

5.4.1 General installation guidelines

When installing steam manifolds, pls. follow these guidelines:

Positioning within duct

- Install the steam manifold as close as possible to the steam humidifier in order to minimize steam loss through condensation.
- Steam manifold placement on the supply side of the air duct is preferable.
- Install steam manifold strictly horizontal in order to ensure proper condensate drain.
- Shown installation and positioning dimensions are based on empiric values. Special environmental conditions may require adjustments. Pay special attention to avoid condensate generation in air duct.

Allowable pressures

- Max. allowable pressure in air duct is 1500 Pa/.218 PSI (exemption: SLE02 only allows for 1200 Pa/.174 PSI).
- On suction side, max. -500 Pa (.07 PSI) is tolerable.
- With high-pressure air conditioning systems, modifications of the unit’s drain hose system may possibly be required depending on the overall pressure situation. These modifications must be coordinated with your expert dealer.

Water drain

- We point out that according to the German Association of engineers (VDI) guideline VDI 6022, a water drain must be provided within the absorption distance inside the air duct.

When increased airflow speed is encountered

- Air flow rates beyond 3m/s (9.84 ft/s) may lead to condensate drainage problems at the steam manifolds due to vacuum built-up. A possible remedy is twisting the steam manifold in its horizontal axis by few angular degrees. In case of problems, pls. consult your expert dealer.

5.4.2 Recommendations for dimensioning

The recommendations given below are based on homogenous air flow in the duct.

Horizontal installation of steam manifold

Standard steam manifold arrangement:

An even distribution of steam manifolds ensures a uniform steam distribution.

Please use the total height of the duct!

*) s. table of manifold lengths

Horizontal assembly position in duct
Minimum distance for condensation avoidance:

- \( L_{\text{min}} = 210 \text{mm/8.3 inch} \): "Steam manifold - Next steam manifold" distance
- \( L_{4\text{min}} = 120 \text{mm/4.7 inch} \): "Lowest steam manifold - Duct bottom plane" distance
- \( L_{5\text{min}} = 120 \text{mm/4.7 inch} \): "Highest steam manifold - Duct ceiling plane" distance

**Number and size** of the steam manifolds available as well as the nominal diameter of the respective steam and condensate hoses may be taken from the tables shown in chapter „Technical Data“.
5.5 Steam line and condensate hose layout

Please note
Because of the high requirements on hose material under the operating conditions given, it is recommended to use genuine HygroMatik hoses only.

5.5.1 Guide lines for steam line design

- Steam hose nominal diameter must not be smaller than the steam outlet of the HygroMatik steam humidifier (do not restrict the cross-section, otherwise back pressure will increase).
- Steam hoses must be laid without sags and kinks and with a continuous slope of 5-10% (otherwise sags may result).
- Steam hoses must be supported every 500 mm (20 inches) by clamp brackets.
- Steam hoses should be kept as short as possible. Implement lengths beyond 5 m (16 ft.) as insulated fixed piping to keep energy loss and condensate generation to a minimum. Beyond 10 m (32 ft.) insulated installation is a must. Fixed piping is generally recommended for straight steam line segments.
- When 2 steam manifolds are in use (other than with a standard implementation), place steam Y piece as close as possible to the steam manifolds. Such, for the main part of the piping just one steam hose is required and condensate loss is minimized.
- Allow easy access to the steam pipe/steam hose installation.
- Pressure conditions within the duct are influenced by device steam output, steam line layout and the duct composition itself. In some rare situations it may become necessary to optimize steam line layout for achieving the results intended.
- Respect minimum bending radii:

<table>
<thead>
<tr>
<th>Diameter</th>
<th>Minimum Bending Radius</th>
</tr>
</thead>
<tbody>
<tr>
<td>DN 25</td>
<td>Rmin = 200 mm/8&quot;</td>
</tr>
<tr>
<td>DN 40</td>
<td>Rmin = 400 mm/16&quot;</td>
</tr>
</tbody>
</table>

5.5.2 Condensate hose layout

The condensate hose may be run from the steam manifold back to the steam cylinder, as depicted in the schematic drawing below with concern to installation type 1. Alternatively, the condensate hose may be fed directly in a wastewater pipe or a drain (s. installation type 2).

Please note
Should condensate return into the steam cylinder be intended, the connection stub on the cylinder upper part must be drilled out first with a ANSI drill size „O” drill. To do so, the steam cylinder must be removed from the housing (s. maintenance chapter, section „Steam cylinder removal and reinstallation”).

Drill out condensate hose connection stub with an 8 mm (ANSI drill size „O”) drill, if required.

Steam cylinder top view
5.5.3 Steam line and condensate hose installation types

Installation type 1

Steam manifold is positioned more than 500 mm above device upper edge:

» Run steam hose to a height of 400 mm/16 inch minimum above the steam humidifier and then to the steam manifold with a continuous incline of 5 to 10 %.

» Feed condensate hose from steam manifold with a decline into wastewater pipe or drain.

» As a steam barrier, lay out a 200 mm/8 inch min. loop (s. schematic representation below). Minimum distance from steam manifold to loop must be 500 mm/20 inch. Fill loop with water prior to steam humidifier commissioning.

Installation type 2

Steam manifold is positioned less than 500 mm above or below device upper edge:

Please note

In this arrangement the condensate hose cannot be fed back to the steam humidifier.

» Run steam hose to a height of 400 mm/16 mm minimum above the steam humidifier and then to the steam manifold with a continuous decline of 5 to 10 %.

» Feed condensate hose to a wastewater pipe/drain with a 200 mm/8 inch diameter loop as a steam barrier. Minimum distance from steam manifold to loop must be 500 mm/20 inch. Fill loop with water.
6. Water connection

**WARNING**
Risk of scalding!
Very hot water to be found in and around the steam humidifier during and after operation.
Have all installation work done by expert staff in order to avoid scalding hazards due to improper water guidance.

**WARNING**
Risk of electrical shock!
Hazardous electrical high voltage!
Before starting installation work ensure that the unit is not yet connected to the power supply.

**General Rules**
- Obey local water utility regulations
- Verify that necessary safety measures have been taken — in compliance with either German Technical and Scientific Association for Gas and Water (DVGW) guidelines (DIN EN1717) or local regulations — to eliminate backflow of polluted water into drinking water treatment facilities. This may require the installation of a system separator and free discharge into the drainage system. Within the humidifier, a double check valve (58) is located in the water supply line. It prevents - in accordance with DIN EN 61770 - the backflow of water. As an option for installation by the customer, the DVGW-conform HyFlow system separator or a after market system separator of the BA/CA type are available from HygroMatik.
- Use feed water without chemical additives and with a conductivity between 200 and 800 µS/cm only. Beyond conductivity levels of 800µS/cm up to a maximum of 1250µS/cm and below conductivity levels of 200µS/cm to a minimum of 125µS/cm, special adjustments are required. In this case please contact your specialist dealer
- Supply water must not exceed 40 °C (104 °F)
- Allowable range of water pressure: 100000 to 1000000 Pa (14.5 to 145 psi)
- For connection to the water supply pipe, make use of a water hose
- Blow-down water must drain freely

6.1 Operation with softened water

**NOTICE**
Do not use softened water unless special measures are taken!

When feeding softened water into the HygroMatik steam humidifier, the aspects outlined below must be taken into account.

Softened water may cause
- unacceptably high conductivity
- the formation of salt bridges between the electrodes and the electrode leads on the inner surface of the steam cylinder upper part
- foaming in the steam cylinder

Salt bridges may cause electrical arcs. These are indicated by the presence of black grooves in the top part of the cylinder. The cylinder must then be replaced to prevent further damage to the cylinder material, as well as short circuits which may trip main circuit breaker.

Foam may come into contact with the maximum level sensor electrode and trigger the max. level status message despite the cylinder not being full yet and the nominal current not yet established.

With softened water, at operating temperature conductivity level usually is higher than is the case with tap water.

If using a water softening system, we recommend diluting the softened water with normal tap water to produce an overall hardness between 4-8°gH. This value can be set lower if the water does not foam.
6.2 Water supply

**NOTICE**

Foreign material in water supply pipe may cause premature wear of the solenoid valve. Flush the water supply pipe before making connection to the solenoid valve. This is of particular importance in case of a newly installed pipe.

» Install a shut-off valve (AV) in the supply line.

» Install a water filter (WF) if required due to bad water quality.

**Please note**

In case of no safety device for drinking water protection according to DIN EN 1717 present in the house installation system, a system separator at least of the CA type or use of the Hyflow retrofit option is mandatory.

Shut-off valve (SV) and water filter (WF) are not included in the delivery.

For connection to the water supply line, the water hose (56) with cap nuts on both ends supplied with the unit may be used.

Make connection as follows:

» Attach cap nut with inner seal ring to inlet screw joint on the humidifier housing and tighten.

**NOTICE**

Do not overtighten the cap nut!

Excessive tightening will destroy the fitting.

**Please note**

Strainer must be placed inside the solenoid valve.

» Screw the other hose end cap nut with its inner seal on a customer-provided water tap (cap nut internal thread is ¾“).

6.3 Water discharge

**WARNING**

Risk of scalding!

During blow down up to 0.3 l/sec (.08 gal./sec) are being drained with a temperature of about 95 °C (203 °F).

Ensure that the drain hose is reliably fastened and wastewater can drain freely and pressureless.

**Please note**

Humidifier installation location and wastewater discharge must be on the same pressure level.
Guidelines for water discharge composition

- Use flexible water hose
- Do not buckle drain hose
- Discharge line and drain pipe material must be temperature resistant up to 95°C (203 °F)

How to proceed

» Run a 1 1/4 " drain hose of 250 to 1000 mm (10 to 40 inch) length into a pressure-free outlet according to DIN EN 1717. The hose must be guided sideways of the humidifier to prevent ascending vapor from condensing on the humidifier’s housing.

» Fit drain hose to connection stub on humidifier housing bottom side.

Grounding clip functioning

The two grounding clips attached to the inner surface of the housing drain stub are in direct contact with water and shunt potential residual electric currents away from the housing during blow-down and in case of a cylinder water overflow.

Between the pump drain hose jacket and the inner surface of the cabinet drain connection, a gap exists due to the diverging diameters. If water collects on the base plate, it will flow through this gap into the drain hose and then into the drainage system.

Please note

With the optional wastewater cooling system HyCool, HygroMatik offers an option for limiting the steam humidifier wastewater temperature in order to protect thermosensitive wastewater pipe lines. By blending with tap water during blow-down and rinse processes, wastewater temperature is below 60 °C (140 °F) as long as inlet water temperature does not exceed 30 °C (86 °F).

6.4 Water connections final check

Go down the following water installation checklist:

☐ All screws and clamps properly tightened?
☐ Water supply line flushed before making connections?
☐ Water connection properly installed?
☐ Water discharge properly installed?
☐ Does blow-down water drain freely?
☐ Water supply line and water discharge leakage-free?
7. Electrical connection

**WARNING**
Danger of electric shock!
Dangerous electric voltage!
All work relating to the electrical installation may only be carried out by designated specialist personnel (electrician or qualified person with equivalent training).

**Please note**
The customer is responsible for monitoring the qualifications of the specialist personnel.

General installation rules

- All local rules concerning the implementation of electrical installations must be obeyed
- Electric connector cables to be laid professionally
- Install the electrical connections according to the wiring diagram
- With units of a nominal power output > 33 kW electrical connection to a permanent line is mandatory (according to VDE 0700 Part 98, IEC 60335-2-98)

**NOTICE**
Potential component damage due to electrostatic discharge!
To protect the sensitive electronic components, measures to prevent damage due to electrostatic discharge must be taken before the start of the installation work.

7.1 Electrical installation approach

Do not connect the steam humidifier to the live power supply before all installation work has been completed.

- Provide fuses with a contact gap of at least .12 inch (3mm) per pole.
- Install a separate main connection for each steam cylinder including main circuit breaker, main switch etc.
- Make main connection according to the table below.

For FLE series main connection, current draw and fusing data, see chapter 13, „Technical specifications“.

**Please note**
HygroMatik recommends the use of slow blowing up to middle time-lag main fuses (only applies to the a.m. mains supply voltage).

Steam humidifier installations should incorporate an individual resilient current circuit breaker.
7.2 Cable connections

The table below shows the quantities and dimensioning of the cable connections provided by the various FlexLine housing types.

7.3 Connection of interlock (safety) system

**WARNING**

**Danger of electric shock!**
Dangerous electric voltage!
After the commissioning of the unit, a 230 VAC voltage is present at terminal 1 when standard wiring is used.

The so-called interlock (safety) system is located between terminals 1 and 2 with terminal 1 holding 230 VAC. For closing the interlock, a make contact is required across terminals 1 and 2. This contact is supplied by relay K21. For energising the relay, a make contact or a bridge is required across the additional terminals on the hat-top rail.

If the interlock (safety) system is open, the humidifier does not start or the operation is interrupted.

![Terminal strip on ST1 of the main-board or ST1.1 of an extension or relay board](image)

Terminal strip on ST1 of the main-board or ST1.1 of an extension or relay board

Additional terminals on hat-top rail

Terminals 1/2 for connection of the interlock (safety) system made accessible via relay K21

Safety equipment can be wired (also in series) into the interlock (safety) system, as shown in the fig. below:

![Diagram](image)

### Please note

The interlock (safety) system is not closed when delivered ex-factory!

In air conditioning, it is standard to incorporate a max. hygrostat in the interlock (safety) system. The max. hygrostat is used as a safety feature in case of a malfunction of the humidity sensor.

7.4 Full wiring diagrams

Pls. find the full wiring diagrams in the respective FlexLine Control Manual:

For climate applications:
FlexLine Control Climate, chapter 7, „Wiring diagrams“

For SPA applications:
FlexLine SPA Control , chapter 8, „Wiring diagrams“

7.5 Electrical installation check list

Check electrical installation with respect to customer-site requirements and local power supply regulations.

☑ Safety interlock properly wired across terminals 1 and 2 of relay K21?

☑ Supply voltage in accordance with name plate voltage rating?

☑ All electrical connections made according to the wiring diagram?

☑ R.h. sensor properly connected with respect to signal type and range (climate applications only making use of a r.h. sensor)?

☑ Temperature sensor properly connected (SPA applications only)?

☑ All screw terminal connections properly tightened?

☑ Have all electrical cable and plug connections been properly tightened?

☑ Proper unit grounding made?
8. Commissioning

**WARNING**
Risk of operating error!
Start-up of the unit is restricted to expert staff only (electricians or expert personnel with equivalent training).

### Step 1: Check of mechanical integrity and wiring
- Open housing cover.
- Check cylinder seating.
- Check steam, condensate and drainhose clamps.
- Check that all electrical wire connections (including steam cylinder wiring) are tight and secure.

### Step 2: Switching on the steam humidifier
- Switch on main breaker.
- Open water supply stopcock (operating pressure should be 1bar min., 10bar max.).
- Switch on unit by setting control switch to "I".

### Step 3: The unit performs a self-test and, then, commences normal operation
- During self-test, the On/Off button icon flashes for a couple of seconds.
- After the self-test of the controller, the display shows the setup view for the basic device settings (language, date, time and control settings). Refer to the chapter "Commissioning" in the operating instructions for the control system.
- Consequently, normal operation is commenced. However, steam is not produced without a demand pending

### Step 4: Trigger steam demand
- Set control to 1-step operation, i.e. permanent steam demand, and close safety interlock.
- Allow all electrical functions to terminate in their programmed order.

### Step 5: Monitor unit function and check for leakage
- Let unit operate for 15 to 30 minutes.
- If leaks appear, switch off the unit.

**WARNING**
Risk of electrical shock!
Hazardous electrical voltage!
Follow safety instructions for work on live components.

### Step 6: Repair leaks
- Find leaks and eliminate.
- Check again for leaks.
- When everything is o.k., reattach housing cover.
9. Maintenance

9.1 General

For the achievement of a long unit life span, regular maintenance is a must. Maintenance works to be performed refer to unit assemblies that underlie either mechanical or electrical wear and tear, or may be impeded by residues in their proper functioning.

A steam humidifier’s optimal performance and the maintenance intervals required primarily depend on the water quality encountered and the amount of steam produced. A particular water quality may shorten or lengthen maintenance intervals. The amount of residues found in the steam cylinder allows for a hint on future maintenance intervals.

Another scenario influencing the unrestricted unit availability is the main contactor lifetime in terms of a maximum number of switch cycles allowed, as indicated by its manufacturer. Unit control monitors the number of switch cycles and produces a service message when the max. number is reached.

9.1.1 Service messages

In case of a service message produced, the HygroMatik logo in the main section of the touch display (for explanations see “FlexLine controls” manuals) is blanked. Instead, a frame is shown with the service icon in it and a “Service message (xx)” (“xx” indexes the message code). When the message frame is touched, the service message is displayed in clear language.

The service messages are listed in detail in the “FlexLine controls” manuals. Following hereafter, pls. find 2 service messages denoted as examples:

• “Steam_amount_counter“ is output when the pre-set produced steam amount is reached
• “Cycles_main_contactor x“ is indicated when the number of cycles pre-set for main contactor „x“ (x = 1...5) is reached. The main contactor should then be replaced and the counter reset (s. “Service” submenu in the “FlexLine controls” manuals).

After a “Steam_amount_counter“ message, maintenance work mainly encompasses checking and cleaning all of the unit parts including the steam cylinder inside, and a unit test run. Steam humidifier electrodes are prone to burn-off during steam production and must, consequently, be replaced in a regular time frame.

As part of the maintenance work, screw terminals and plug connections must be checked every time. If required, retightening the terminal screws is a must as well as ensuring tight fit of all of the plug connections.

Since steam and condensate hoses are subject to wear as well, hoses must also be checked regularly for tightness, flexibility and firm seating.

Seals are wear parts. As such, seal integrity checks and replacement is also a part of the regular maintenance work.

9.1.2 Service messages for preventative maintenance

HygroMatik steam humidifiers continuously monitor the performance of the following functional areas:

• Electrode condition (wear control by means of cylinder full monitoring)
• Blow-down operations
• Cylinder filling

When reaching pre-set trigger levels, unit control outputs preventative service messages that relate to the corresponding functional area.

The functional area addressed should then be checked at short term and maintained, if required (s. “FlexLine controls” manuals, “Faults and service messages“ chapter”).
9.1.3 Safety instructions for maintenance

⚠️ WARNING

Risk of electrical shock!
Hazardous electrical voltage. Unit must be switched off and protected against restart by expert staff (electricians or expert personnel with equivalent training) before any maintenance work is commenced.

⚠️ WARNING

Risk of skin burning!
Hot steam cylinder during operation and for some time afterwards. Drain steam cylinder before any maintenance work is commenced. After that, wait approx. 10 mins before starting maintenance work. Check steam cylinder temperature by cautious approximation with hand (do not touch!).

⚠️ WARNING

Risk of scalding!
Water pumped or drained from the steam cylinder may have a temperature of up to 95 °C (203 °F). Wear proper PPE (Personal Protection Equipment)!

⚠️ NOTICE

Take care of ESD protection!
The electronic components of the humidifier control are very sensitive to electrostatic discharges. In order to protect these components during maintenance, steps must be taken to guard against damage from electrostatic discharge.
9.2 Maintenance framework

Mineral deposits precipitate and crystallize very differently in different types of water, even when two types have the same conductivity and hardness levels (the various constituents in the water interact differently).

Instructions on maintenance and cleaning intervals, or on electrode service life, are based entirely on empirical data.

In most cases, the conductivity levels given in the "Directions for Use" section of this manual may be considered as typical values. Individual parameter settings as part of the control software may be necessary.

Very seldomly, water pretreatment may be necessary (softening by dilution to approx. 4 - 8 °gH; decarbonization/partial desalination to achieve target reductions in carbonate hardness).

For any questions with regard to water treatment systems pls. contact your expert dealer.

9.3 Removal and reinstallation of the steam cylinder

**CAUTION**

**Risk of eye injuries!**
The clips that fix the steam cylinder halves have sharp edges and can jump off during dismantling. Eye injuries are possible. Wear proper PPE (Personal Protection Equipment)!

Steam cylinder removal

- Set control switch to „II“ position for residual water draining
- When cylinder is empty, set control switch to „0“ position
- Disconnect unit from power supply
- Remove unit housing cover
- Remove SuperFlush solenoid hose from cylinder bottom (if applicable).
- Remove steam hose from steam hose adapter.

If the steam hose is not to be disconnected, the steam hose adapter with the steam hose still attached may be detached from the steamcylinder as shown in the next figure.
Remove clip from steam hose adapter

Push clip onto adapter outside of unit housing

Disconnect cabling

Remove cylinder flange clamps

Separate cylinder halves

Lift steam cylinder from cylinder base

Remove o-ring in use
Reinstallation

When re-assembling the cylinder, brackets and reinforcement joints of the two cylinder parts must be aligned.

Please note

When re-assembling the cylinder, brackets and reinforcement joints of the two cylinder parts must be aligned.

Insert new o-ring in steam hose adapter and cylinder base positions

Insert new o-ring

Place cylinder vertically in cylinder base

Join cylinder halves and affix with clamps

Remove o-rings in use from steam cylinder top and cylinder base

Reconnect electrode cabling
Please note
The electrode connections must not show any signs of corrosion. Replace plugs, if required. Plugs must sit firmly on the electrode pins and must be pushed down as far as they will go.

» Reattach SuperFlush solenoid hose (if applicable) to steam cylinder bottom stub.

- Attach steam hose adapter to cylinder
- Affix steam hose adapter with clip
- Open water supply
- Activate main circuit breaker
- Check for leakage in relevant areas

» Reattach unit housing cover
9.4 Steam cylinder, electrodes and cylinder base cleaning

For cleaning, mechanical removal of the deposits is usually sufficient.

**NOTICE**

Risk of functional disruption!
When using acids or other chemicals for cleaning, thoroughly flushing and rinsing is essential otherwise cylinder water conductivity may be impaired.

Steam cylinder cleaning

» Check the inside of the top part of steam cylinder for crust build-up and possible salt bridges (black grooves between the electrode leads). If present, wash away/scrape off completely.

» Check the inside of the top part of steam cylinder for crust build-up and possible salt bridges (black grooves between the electrode leads). If present, wash away/scrape off completely.

Please note

If electrical arcs have burned deep grooves into the material, the complete cylinder must be replaced.

Electrode cleaning

» Clean the sensor electrode until metallically bright.

» Clean electrodes and check electrode wear (s. „Changing electrodes“ section).

Cylinder base cleaning

» Just as the cylinder, the cylinder base and its connection joints must be checked for deposits and be cleaned, if required.

Reinstallation of the steam cylinder is to be performed as described in the „Cylinder removal and reinstallation“ section.

9.5 Checking cable connections

**NOTICE**

Risk of functional disruption!
Risk of material damage!

Loose cable connections may result in increased transition resistance and contact area overheating.

» Check all cabling screw terminals and plugs for tight seating. Plugs must sit on their respective contacts as far as they will go.

» Check electrode plugs for corrosion. Replace, if stained.
9.6 Solenoid valve removal/reinstallation and fine filter cleaning

Removal

» Shut off water supply and disconnect tap water hose cap screw connection.

» Remove connecting hose (20) from cylinder base.

» Detach electrical cable connector from solenoid valve (25).

» Unscrew solenoid valve mounting screws.

» Remove solenoid valve from housing bore.

Fine filter cleaning

» Remove fine filter from solenoid valve tap water connection side and clean under running water.

Reinstallation

» Reinsert fine filter into solenoid valve.

» Reinsert solenoid valve with seal in unit housing bore.

» Bolt-down solenoid valve.

» Reestablish tap water connection.

» Reconnect electrical cable to solenoid valve.

» Reattach connecting hose (20) to cylinder base using clamp.

» Turn on water tap.

» Switch on unit and check for leakages after 15 to 30 mins of operation.

Risk of electrical shock!
Hazardous electrical voltage!
Follow safety instruction for work on live components.
Leakages may invoke leak currents.

» In case of leakage turn off power supply and secure against being switched on again.

» Find leakage and eliminate.

» Check again.
9.7 Cleaning of blow-down pump

Removal and cleaning

» Remove steam cylinder as described in „Removal and reinstallation of steam cylinder“ section.

» Detach adapter (30) from pump (32).

» Detach electrical cable from pump.

» Unscrew mounting screws from housing bottom plate (safe vibration buffer, bolts and washers for reinstallation) and pull pump out of cylinder base (37).

» Open pump bayonet lock.

» Remove residues from pump and drain hoses (replace O-ring if required).

Reinstallation

» Moisten O-ring (33) and insert into cylinder base (37) horizontal stub.

» Push pump back into cylinder base and bolt to bottom plate incorporating the vibration buffer and washers saved during removal.

» Moisten O-ring (31) and insert into adapter.

» Slide adapter (30) onto pump stub.

» Refit electrical cable to pump connector (no polarisation).

» Let unit run for 15 to 30 mins, then check for leakages.

⚠️ WARNING

Risk of electrical shock!
Hazardous electrical voltage!
Follow safety instructions for work on live components.
Leakages may invoke leak currents.

» In case of leakage turn off power supply and secure against being switched on again.

» Find leakage and eliminate.

» Check again.
9.8 Inspection of hoses
Since steam and condensate hoses are prone to wear as well, those hoses should undergo regular checks as well.

9.9 Electrode replacement

» Remove and open cylinder, as described in section "Removal and reinstallation of the steam cylinder"

**Please note**
When mounting the electrodes, make sure that the hand nut colours corresponding with the wiring colours remain in the same position as before in order to omit any unwanted shift of electrical potential. Hence, the hand nut positions must be recorded before they are removed. During reassembly, particular care must be taken to ensure that no grey wire is connected to the electrode plug next to the (grey) sensor electrode hand nut.

» Unscrew hand nuts (49)

» Remove electrodes (48)

» Install new electrodes (48). Make sure that the electrodes are positioned correctly (see exploded view).
Genuine electrode length

HygroMatik large area electrodes made from stainless steel have the following genuine lengths:

<table>
<thead>
<tr>

<td>310</td>
</tr>
</tbody>
</table>

*) The electrodes installed in the new CY45/2 steam cylinder feature a length of 300 mm

Electrode wear

Electrode wear depends on:

- composition and conductivity of the supply water
- the amount of steam produced

9.10 Functional check

» Run the system with maximum output for a couple of minutes
» Check all safety devices.
» Check hose connections and seals for leakage.

9.11 Finishing maintenance

After finishing substantial maintenance work, the service interval must be reset by means of the „Service-reset_cyl. 1“ or „Service-reset_cyl. 2“ parameters (only with double cylinder units), s. „FlexLine controls“ manual, „Service“ submenu.

The steam amount counter now again holds the value preset that determines the next maintenance requirement when reached.
10. Dismantling

Once the steam humidifier will no longer be used, dismantle (demolish or scrap) it by following the installation procedures in reverse order.

⚠️ WARNING

Warning: Dismantling of the unit may only be performed by qualified personnel. Electrical dismantling may only be performed by trained electricians.

Please note

Obey the safety guidelines in section “Safety Instructions,” especially the guidelines for disposal.

The products listed below are eligible to bear the CSA Mark shown with adjacent indicators 'C' and 'US' for Canada and US or with adjacent indicator 'US' for US only or without either indicator for Canada only.

![CSA Mark]

**Products**

CLASS - C121106 - COMFORT CONDITIONING EQUIPMENT - Humidifiers and Evaporative Coolers

CLASS - C121186 - COMFORT CONDITIONING EQUIPMENT - Humidifiers and Evaporative Coolers - Certified to U.S. Standards

Humidifiers, electrode type, stationary, industrial or commercial, rated 600V or less, 60Hz, 1 ph or 3 ph, as follows:

- Models MS05, MS10, 3.5 kW max. (1 ph) and 7.5 kW max (3 ph).
- Models C01, C02, C06, C10, C17, C22, C30, C45, C58: 14.4 kW max. (1 ph) and 43.5 kW max (3 ph).
- Models HY05, HY08, HY13, HY17, HY23, HY30, HY45, HY60, HY90, HY116; 28.8 kW max (1 ph) and 87 kW max (3 ph).
- Models FLE01, FLE02, FLE05, FLE10, FLE15, FLE20, FLE25, FLE30, FLE45, FLE65, FLE80, FLE100, FLE130; 14.4 kW max (1 ph) and 50.8 kW max (3 ph) per cylinder.
- Models SLE01, SLE02, SLE05, SLE10, SLE15, SLE20, SLE30, SLE45, SLE65; 14.4 kW max (1 ph) and 50.8 kW max (3 ph).
Notes:
1. Model designation may be followed by suffix letters and numbers denoting type of control, supply voltage, number of phases.
2. Installation of the equipment in the field is subject to acceptance by the local inspection authority.

APPLICABLE REQUIREMENTS

CSA Std C22.2 No. 104-11 (4th Ed) (R2016) - Humidifiers
UL Std No. 998 (5th Ed) - Humidifiers
Supplement to Certificate of Compliance

Certificate: 1887098  
Master Contract: 238708 (238708)

*The products listed, including the latest revision described below, are eligible to be marked in accordance with the referenced Certificate.*
